

中国齿卷蛾属的研究(鳞翅目:卷蛾科)

刘友樵 白九维

(中国科学院动物研究所)

齿卷蛾属 *Ulodemis* 系 Meyrick (1907) 根据模式种 *trigrapha* 所建立。到目前为止, 世界上总共记载有五个种, 都分布在亚洲南部的印度、斯里兰卡和印度尼西亚境内的山地, 而我国过去尚无分布记录。

近年来, 作者从收集到我国福建、广东、四川、广西、云南等省小蛾类标本中发现这属一老种和一新种。

1. 多齿卷蛾 *Ulodemis trigrapha* Meyrick (新纪录)(图1、3、5)

分布 云南(景东、勐仑、勐海、勐啊、大勐龙), 四川(渡口), 广西(龙胜、龙州、凭祥), 广东(广州、海南岛)。

2. 三齿卷蛾 *Ulodemis tridentata* 新种(图2、4、6)

翅展 19—23 毫米。体、翅棕褐色。雄蛾颜面鳞片灰褐色, 触角第二节有凹陷。下唇须长, 向前伸, 第二节特别长而膨大。前翅近长方形; 雄蛾外缘直; 雌蛾在顶角两侧有凹陷; 臀角圆; 基斑和中带明显, 外围有淡黄色夹边; 基斑起于前缘基部的 1/4, 止于后缘基部的 1/3; 中带起于前缘 1/2, 止于后缘 2/3; 端纹不明显; 中带至外缘间有许多分散灰褐色斑点。后翅灰褐色, 雄蛾基部有一束长毛。前翅 R_1 和 R_2 脉共柄, R_2 脉止于外缘。后翅 m_3 和 Cu_1 脉同出于一点或有短共柄, m_2 脉基部和它们十分靠近; m_1 脉和 R_s 脉同出于一点或十分靠近。雄性外生殖器的爪形突细长, 端部膨大呈椭圆匙形; 颞形突宽大, 末端分三齿, 中间齿短, 两侧齿长而相等; 抱器腹呈条状, 有弯曲; 阳茎圆柱状, 有 90 度弯曲。雌性外生殖器产卵瓣宽大, 呈长椭圆形; 交配孔两侧前、后阴片下垂呈兜状; 导管端片几丁质化; 囊突一枚, 呈镰刀状。

正模♂, 四川峨眉山万年寺; 1041 米; 1979. VI. 14; 刘友樵。配模♀, 四川峨眉山清音阁; 900 米; 1957. IV. 30; 朱复兴。副模 7♂♂、4♀♀, 福建武夷山; 750 米; 1979. VI. 31. 宋士美; 四川青城山; 1000 米; 1979. VI; 峨眉山; 900 米; 1980. VI—VIII; 刘友樵, 白九维。

本种与多齿卷蛾 *U. trigrapha* 在外形和斑纹上难以识别。但多齿卷蛾体、翅呈黄褐色; 雄性外生殖器爪形突端部膨大部分小, 呈圆匙形; 颞形突末端有齿状突 10 枚左右, 是两种的主要区别。

模式标本保存在中国科学院动物研究所。

NOTES ON CHINESE *ULODEMIS* MEYRICK (LEPIDOPTERA: TORTRICIDAE) WITH DESCRIPTION OF A NEW SPECIES

LIU YOU-QIAO BAI JIU-WEI

(Institute of Zoology, Academia Sinica)

The genus *Ulodemis* of the subfamily Tortricinae, tribe Archipini, established by Meyrick, 1907, is a small group with limited distribution in the South of Asia.

This paper records 2 species of Chinese *Ulodemis* Myr. collected by the authors in 1978—1980. Among them, one species is described as new and one species is recorded for the first time.

1. *Ulodemis trigrapha* Meyrick

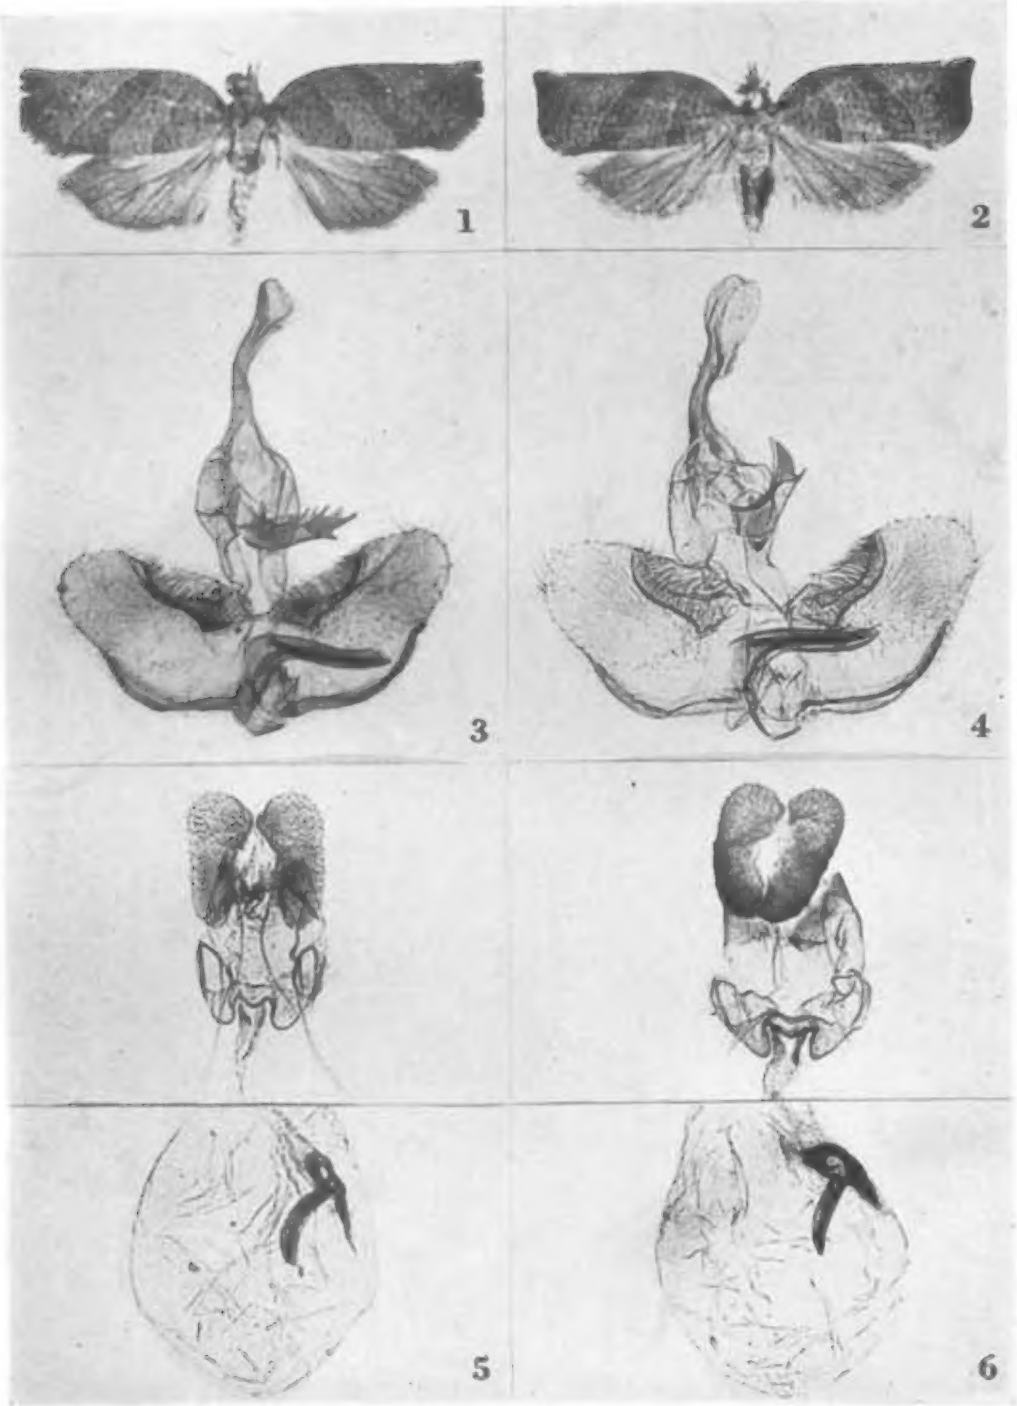

Distribution: Yunnan, Guangdong, Fujian Provinces and Guangxi Zhuang Autonomous Region.

2. *Ulodemis tridentata* sp. nov.

Wing expanse 19—23 mm. Body and wings dark brown in color. Forehead in male covers with greyish-brown scales, antennae notched. Palpi long, porrect, 2-segment long and expanded. Forewings elongate-oblong; in male slightly narrowed anteriorly, without fold, apex obtuse, termen nearly straight, little oblique; in female sinuate nearly vertical; strewn with brownish-grey dots. Hindwings brownish-grey, in male with a dorsal pencil of long dark grey hairs. Male genitalia with a long uncus, terminal expanded like a spoon; gnathos large, ending with 3 strong tooth; aedeagus conical, curved. Female genitalia with large oblong ovipositors; lamella vaginalis funnel-shaped on both sides of the antrum; signum a large thorn, with a sideways turned capitulum.

The general appearance of *tridentata* is close to *trigrapha*, but differentiated chiefly by the dark brown color of the body and wings, the much more expanded tip of the uncus and the three teeth of the gnathos.

Holotype (♂): Sichuan, Emei Shan, 1041 M., 14. VI 1979, Liu Youqiao. Allotype (♀): Sichuan, Emei Shan, 900 M., 30. IV. 1957, Zhu Fuxing. Paratype (7 ♂♂, 4 ♀♀): Fujian, Wuyi Shan, 750 M., 31. VI. 1979, Song Shimei; Sichuan, Emei Shan (900 M., VI. 1979.) and Qingcheng Shan (1000 M., VI-VIII. 1980.), Liu Youqiao and Bai Jiuwei. All specimens, including the types of new species, are now kept in the Institute of Zoology, Academia Sinica.

1. 多齿卷蛾 *Ulodemia trigrapha* Meyrick

3. 雄性外生殖器

5. 雌性外生殖器

2. 三齿卷蛾 *Ulodemia tridentata*, sp. nov.

4. 雄性外生殖器

6. 雌性外生殖器
